

CS 362 In-Class Exercise 4: Project Beta Testing

Your name: Logan Jordan

Project team number that you are testing (e.g., team 1): 14

PART-1: Organization and Purpose (2 pts)

Q1) Does the repository provide a README explaining the purpose of the software? If yes, based on reading that documentation, do you understand all the interesting features provided by the software? Do you have any advice to improve that documentation?

Yes. The README documentation is very in depth and comprehensive. It explains and describes everything that you need to know to not only run the software, but a detailed usage guide, and troubleshooting.

PART-2: Installation and Setup (1 pts)

Q2) Is the documentation to install or setup the software available? (Note that for a web application, it would be a URL to access the website and instructions to host the website on a server). When following the instructions, do you face any difficulties while installing the software (accessing the URL for a website)? If yes, please explicitly state what issues you encountered, so that the project team can fix them.

NOTE: If you are testing a web application, then you do not need to set up a web server and try hosting the web application. Just go through the documentation to find out if it clearly explains the steps to host the website.

Yes, the documentation to install and compile the software is available. The quick start instructions should include an initial instruction step to clone the repo to make it clearer rather than the first step being "in Chess_plusplus directory use: make run". When following the instructions, I faced no difficulties installing the software.

PART-3: Functional and Non-Functional Testing (2 pts)

Q3) Select a use case for the application-under-test and use your creativity to test the application in different possible ways. For example, if you are testing a login functionality, then test the sign up feature, sign in, adding invalid credentials, special characters, etc. Please provide the details of the use case you tested on the software by describing exactly what all you did and in what order? Make sure you are making notes while doing this. If you find any issues (e.g., something that was confusing, incorrect, or not working at all), please provide as many details as you can to replicate the issues so that the team can fix them.

There is no use case stated to test in the README. I had to go into the project living document to find a use case to test. I chose to test use case 1: Learn and Practice Chess, Beginner Level. Here's what I did:

1. I tried random invalid inputs on the main menu (0, 11, 999999, a, =, null)
 - a. Entering any character other than an integer in a menu that expects an integer breaks the software. **BUG**
2. I chose the lessons menu option (6)
3. I chose the beginner lessons option (1)
 - a. Lesson 1: Pawn Movement correctly starts.
 - b. Hints work properly.
 - c. Skips work properly, stating the correct move.
4. Typing the correct move (e2e4) continues the lesson to Lesson 2: Knight Movement.
5. Typing an incorrect move (g1h3) decrements an attempt and states it's not the expected move for the lesson.
